

Monkeypox IgG/IgM Rapid Test

Monkeypox is an infectious disease caused by the monkeypox virus that can occur in certain animals, including humans. Symptoms begin with fever, headache, muscle pains, swollen lymph nodes, and feeling tired. This is followed by a rash that forms blisters and crusts over. The time from exposure to onset of symptoms is usually 7 to 14 days. The duration of symptoms is typically two to four weeks. Humans can be infected by an animal via a bite, or by direct contact with an infected animal's bodily fluids. The virus can also spread from human to human, by respiratory (airborne) contact or by contact with an infected person's bodily fluids.

- Get results in just 10 minutes
- High Sensitivity
- Reliable Result

Intended Use

Monkeypox IgG/IgM Rapid Test Cassette (Whole Blood/Serum/Plasma) is a solid phase immunochromatographic assay for the rapid, qualitative and differential detection of IgG and IgM antibodies to monkeypox virus in human whole blood, serum or plasma. This test provides only a preliminary test result.

Materials Supplied

- 1/5/25 Test cassettes
- 1/5/25 Droppers
- 1 Buffer
- 1 Package insert

OPTIONAL MATERIALS

- Uni-dose buffer
- Alcohol pad
- Sterile lancet
